1) a)

Pipeline is a performance improvement technique in which multiple instructions are overlapped in execution. Due to pipelining throughput is increased so it is very helpful for a set of instructions. It isn't that much helpful ^{for} a single instruction but if I consider a 1000 instructions pipelining will definitely help. It will reduce the total execution time, as due to it completing the instructions takes less clock cycles.

c) b)

Stages, $k = 6$

Time = 20 ns, 20 ns, 30 ns, 30 ns, 20 ns & 20 ns.

Non pipeline machine:

$$\begin{aligned}\text{Instruction latency}_0 &= 20 + 20 + 30 + 30 + 20 + 20 \\ &= 140 \text{ ns}\end{aligned}$$

$$\text{For 77 instructions} = 140 \times 77 = 10780 \text{ ns}$$

Pipeline machine:

$$\begin{aligned}\text{Instruction latency} &= \text{maximum of all instructions time} \\ &= 30 \text{ ns}\end{aligned}$$

$$\begin{aligned}\text{For 77 instructions} &= (30 \times 6) + (30 \times 76) \\ &= 180 + 2280 = 2460 \text{ ns}\end{aligned}$$

$$\text{Speedup} = \frac{\text{non-pipeline time}}{\text{pipeline time}}$$

$$\Rightarrow \frac{10780}{2460} \text{ @ } \textcircled{CS}$$

$$= 4.382 \text{ times}$$

Pipeline :

Example:
clock cycle = $15 \times 5 = 75$ clock cycle

Pipeline :

$$\text{clock cycle} = k + n - 1 \quad \begin{cases} k = \text{no. of stages} \\ n = \text{no. of instruction} \end{cases}$$

$$= 5 + 15 - 1$$

$$= 19 \text{ clock cycle}$$

$$\text{speedup} = \frac{75}{19} = 3.947$$

$$\text{utilization} = \frac{\text{use block}}{\text{Total block}}$$

$$= \frac{2515 \times 5}{19 \times 5} = 0.7894$$
$$= 78.94\%$$
